What Matters Most

The Case for **Active**
Risk Management

Investors Know Their Priorities

The first priority is usually—

“I don’t want to lose my money.”

This would probably explain why risk management featured so prominently in a recent survey conducted by Franklin Templeton in partnership with ORC International.

When respondents were asked what they considered important when choosing investments, risk management topped the list. A close second was the ability to beat the overall market’s performance, and thirdly to lose less than the market when it’s down.

WHAT INVESTORS SAID IS MOST IMPORTANT TO THEM¹

Five Reasons Investors Need Active Risk Management

The impact of the global financial crisis reminded people of the importance of risk management. Active management and risk management go hand in hand. In fact, without diligent active management of investments, risk management is typically non-existent.

This brochure presents five reasons why active risk management is crucial for investor outcomes.

1 | Indexes Are Indifferent to Bubbles

Passive investments often follow a market capitalisation weighting process that allocates more to potentially overvalued stocks—even when the valuations reach staggering heights.

2 | It's Important to Reduce Your Downside Exposure

Small reductions in downside performance can make a big difference in long-term returns.

3 | Volatility Matters—Especially in Retirement

When combined with consistent withdrawals (aka retirement income), market losses can be significantly harder to overcome.

4 | You Need Real People to Be Able to Apply Real Experience

There really is no substitute for experience when it comes to investing.

5 | Effective Risk Management Requires a Truly Active Manager

Not all actively managed funds measure up the same when it comes to differentiating their portfolios from their benchmarks. Effective risk management requires a truly active approach.

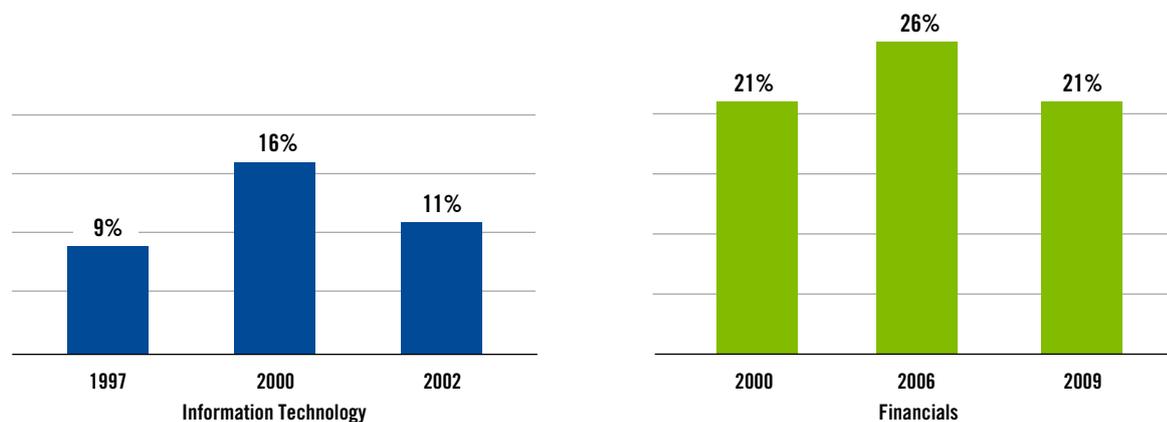

1 | Indexes Are Indifferent to Bubbles

Indexes, and the passive investments that track them, are dispassionate followers of market behaviour. If a sector or region becomes the darling of the day, there is no oversight to counterbalance that sentiment. The charts below show historical stock “bubbles” and their aftermaths, which resulted from the rapid price appreciation of certain segments of the market. As the stock prices in those segments ran up, they became an even greater portion of the index.

Two Noteworthy Sector Bubbles

In periods of rising markets, a market capitalisation weighting process that allocates more to potentially overvalued stocks can work to an index return’s benefit. However, when the story changes, as in 2000, 16% of the MSCI World Index was represented by tech stocks, or at the end of 2006, when 26% was represented by financials, this approach can be risky. See below how the MSCI World Index weightings readjusted downward due to sector-specific declines.

MSCI World Index Sector Weightings²

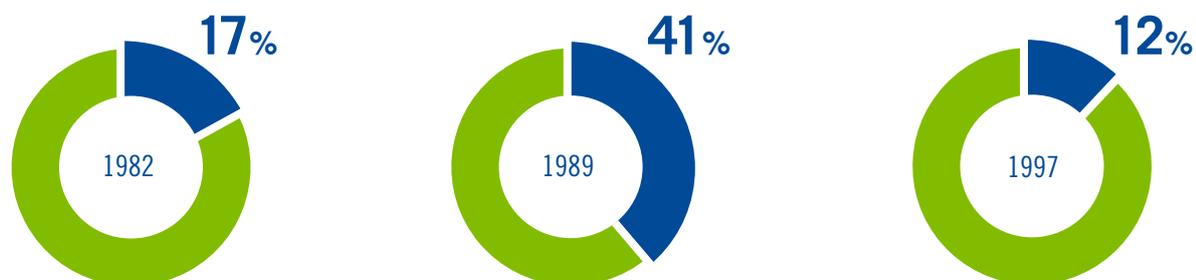

For illustration and discussion purposes only.

One Famous Geographic Bubble

Similarly, Japan’s massive run-up in the late 1980s led to a subsequent spectacular collapse. At its height, Japanese stocks composed well over a third of the MSCI World Index.

2 | It's Important to Reduce Your Downside Exposure

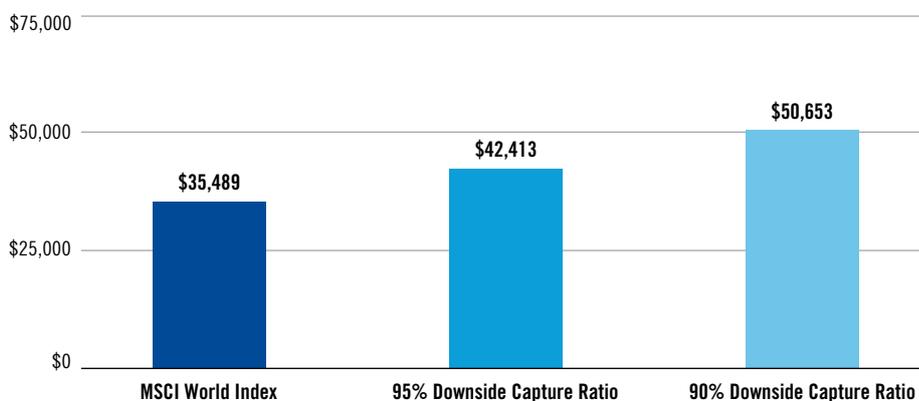

There are good reasons why investors say risk management is so important. But while investors may be more focused on what risk does to their anxiety level, it's probably more important to look at what volatility can do to their bottom line.

Downside capture is a statistic that indicates how correlated a fund is to a market when the market declines. The lower the downside capture, the better the fund has preserved wealth during market downturns. Over time, a lower downside capture can make a significant difference to an investor's portfolio.

LOWER DOWNSIDE CAPTURE CAN MEAN BETTER PERFORMANCE OVER TIME

Hypothetical Growth of a \$10,000 Investment⁴

What If the MSCI World Index Was Managed for Risk?

With so many stocks included in the index, it would be easy to think that performance wouldn't improve that much just by excluding the five worst or even the 100 worst performing stocks in any given year. However, the long-term numbers tell a different story.

AVOIDING THE WORST PERFORMING STOCKS CAN MAKE A BIG DIFFERENCE

3 | Volatility Matters—Especially in Retirement

The math behind loss recovery is part of the reason that lowering downside capture is so important. Equal percentage returns on the downside and the upside won't get an investor back to square one. See the recovery gains needed to offset declines in the table below.

Investment Losses Are Experienced Exponentially when Taking Retirement Distributions

The importance of managing risk is heightened by the wave of investors currently nearing or entering retirement. Many will be looking for more than just market accumulation from their investments; they will also be looking for income. When combined with consistent withdrawals (aka retirement income), market losses are significantly harder to recover from.

| | Returns Required to Recover Initial Loss (without withdrawals) | Returns Required to Recover Initial Loss—with 5% Annual Withdrawals (based on initial \$100,000 value) for 5 Years |
|---------------------|--|--|
| 10% _{LOSS} | +11% | +54% |
| 20% _{LOSS} | +25% | +82% |
| 30% _{LOSS} | +43% | +122% |
| 40% _{LOSS} | +67% | +186% |

For illustration and discussion purposes only.

4 | You Need Real People to Be Able to Apply Real Experience

Even the most efficiently run traditional passively managed index portfolio has no memory of the last bear market, or the last bull market for that matter. There is no learning from mistakes or successes, as these portfolios are primarily designed to mimic a benchmark.

By contrast, Franklin Templeton managed funds are guided by some of the most experienced managers in the industry, with average tenure of 17 years at the firm and over 25 years of industry experience.⁶

“The Global Bond Team’s unconstrained approach gives us maximum flexibility to not only manage risk, but also to take advantage of global opportunities for investors.”

Dr. Michael Hasenstab • CIO Templeton Global Macro • Industry Experience: 22 Years

“Our portfolio exposures are set not only based upon valuation combined with quantitative factors, but a consideration of uncertainties.”

Andrew Sisson • Managing Director, Balanced Equity Management • Industry Experience: 42 Years

“In today’s interest rate environment, it’s especially important for fixed income investors to have portfolios that are managed with an eye on risk.”

Christopher Molumphy • CIO Franklin Templeton Fixed Income Group® • Industry Experience: 30 Years

“Risk management has always been an integral part of our investment process at Templeton. We view risk primarily as the permanent impairment of capital, not as short-term volatility. Volatility can actually provide opportunities for investors with a fundamental focus and long-term investment horizon.”

Peter Wilmshurst • Portfolio Manager/Research Analyst, Templeton Global Equity Group
• Industry Experience: 24 Years

“We construct concentrated portfolios that are benchmark indifferent and have a relatively high active share while seeking to limit the overlap of economic exposures among holdings within each portfolio as a way to manage risk.”

Coleen Barbeau • Director of Global Growth Portfolio Management, Franklin Global Equity Group
• Industry Experience: 36 Years

5 | Effective Risk Management Requires a Truly Active Manager

Benchmark indexes and portfolios that are modeled after them do not discriminate when it comes to risk potential. This is one reason it is important to know how much an actively managed fund is distinctly different from its benchmark index.

Some funds may actually be “closet indexers,” which means they are invested very similarly to their benchmark indexes, while other funds have a composition that is very different from their benchmark indexes. A measurement called “Active Share” can help investors identify truly active managers. Active Share can be a particularly informative metric when looking at funds with broad and diversified benchmark indexes, such as the S&P 500, the Russell 2000 or MSCI World.

Active Share

The portion of stock holdings in an actively managed fund that differs from its benchmark index. Active share:

- Helps to identify “closet indexers”
- Ensures you’re getting what you’re paying for—active management
- Identifies potential for relative outperformance

THE THREE WAYS THAT ACTIVELY MANAGED FUNDS CAN EARN THEIR ACTIVE SHARE SCORE

| | Fund A ⁷ | MSCI World Index ⁸ |
|---|---|---|
| 1 | HOLD a stock NOT FOUND in the index | NOT FOUND |
| |  | |
| 2 | NOT HOLD a stock FOUND in the index | FOUND |
| | |  |
| 3 | Hold MORE OR LESS of a stock in the index | |
| |  Adobe 3.03% |  Adobe 0.22% |

“It makes sense that portfolios that are less like indexes lead to performance that is less like an index. So, it seems a safe bet that active share can help investors build better portfolios and have realistic expectations about performance.”

–MORNINGSTAR¹⁰

Investors Have Spoken

As mentioned earlier, the majority of investors participating in the recent Franklin Templeton/ORC International survey stated that these three things were important to them:

- Losing less than the market when the market is down
- Investing in products that can outperform the market
- Risk management

Franklin Templeton Investments understands why these are priorities for investors. That’s why for over 65 years, our firm has used an active management approach.

WHAT ARE THE RISKS?

All investments involve risks, including possible loss of principal. Stock prices fluctuate, sometimes rapidly and dramatically, due to factors affecting individual companies, particular industries or sectors, or general market conditions. Bond prices generally move in the opposite direction of interest rates. Thus, as the prices of bonds in a fund adjust to a rise in interest rates, a fund's share price may decline. These and other risk considerations are discussed in the appropriate fund prospectus.
